### Arista Design Guide Data Center

Arista Networks Macro-Segmentation Service (MSS™) Design & Deployment Guide Contemporary trends in data center architectures such as mobile applications and IoT present many new possible entry points for security breaches that are not protected by legacy security infrastructure.

### Design and Deployment Guides - Arista

This design guide describes an Arista solution for providing simple, robust, and cost-effective data center interconnection (DCI) that enables layer-2 services to be bridged between multiple sites over existing layer-3 IP networks. This solution is completely standards-based and can be deployed over existing routed TCP/IP transport networks.

### ARISTA DESIGN GUIDE Data Center Interconnection with VXLAN

The Arista Universal Cloud Network Design Guide is based upon common use cases seen from real customers. The UCN Design guide shows a set of solutions, features, and applications that are leveraged to meet the customer's demands.

Design Guide 6 The concept behind Arista's Universal Spine is: • Build a spine that meets the needs of all Data Centers • Reliable and simple to operate • Interoperate with any and all vendors' equipment, leaf switches, firewalls, Application Delivery Controllers etc.

### Layer 2 Leaf & Spine Design and Deployment Guide

The Arista Data Center design uses an Anycast default gateway insertion technique known as Virtual Address Resolution Protocol or VARP. On a MLAG pair both switches coordinate the advertisement of an identical MAC and IP address (the VARP address) for the default gateway on each segment.

### Layer 3 Leaf & Spine Design and Deployment Guide

All Arista reference designs revolve around common central design goals. Simplified Standards-based Architecture: Arista is an established leader in data center network architectures designed for consistent performance, deterministic latency, and easy troubleshooting regardless of workload and deployment sizes.

Arista Networks was founded to pioneer and deliver software-driven cloud networking solutions for large data center storage and computing environments. Arista's award-winning platforms, ranging in Ethernet speeds from 10 to 100 gigabits per second,

### Software Driven Cloud Networking - Arista

Traditional three-tier data center design The architecture consists of core routers, aggregation routers (sometimes called distribution routers), and access switches. Between the aggregation routers and access switches, Spanning Tree Protocol is used to build a loop-free topology for the Layer 2 part of network.

A good rule-of-thumb in a modern data center is to start with an oversubscription ratio of 3:1. Features like Arista Latency Analyzer (LANZ) can identify hotspots of congestion before it results in service degradation (seen as packet drops) allowing for some flexibility in modifying the design ratios if traffic is exceeding available capacity.

F16 and HGRID are the topologies, and Minipack and the Arista 7368X4 are the platforms that are the core of our new data center network. They all bring significant improvements in power and space efficiency and reduce complexity in the overall network design, while building upon readily available, mature 100G optics.

**Data Center Interconnection with VXLAN, design guide**

The focus in this design guide is VxLAN as the protocol for the data-plane encapsulation for the overlay tunnels, and the functionality of the Multiprotocol BGP (MP-BGP) EVPN address-family for control plane signaling in the overlay.

**Arista EOS Central - Category - VXLAN**

Introduction This document describes the operation and configuration of BGP EVPN Services over a VXLAN (Virtual eXtensible LAN) overlay on Arista platforms. The focus in this design guide is VxLAN as the protocol for the data-plane encapsulation for the overlay tunnels, and the functionality of the Multiprotocol BGP (MP-BGP) EVPN address-family for control plane signaling in the overlay.

The benefits of BGP including fast fallover and sub-second convergence are covered in RFC7938 and L3LS Design & Deployment guide; links quoted earlier in the thread. The key to fast convergence is running eBGP single-hop sessions over direct point-to-point Leaf-Spine routed links on 10/40/100G Ethernet which inherently offers Link Fault Signaling.

**Arista EOS Central - Spine-Leaf BGP EVPN Best Practice**

Data center network design moves from tree to leaf Leaf-spine designs are pushing out the hierarchical tree data center networking model, thanks to the popularity of Ethernet fabric networks. Arista EOS support hardware for Leaf ( ToR ), Spine, and Spline data center design layers.
