The present lecture notes describe stochastic epidemic models and methods for their statistical analysis. Our aim is to present ideas for such models, and methods for their analysis; along the way we make practical use of several probabilistic and statistical techniques. This will be done without focusing on any specific disease, and instead

This enables us to model the window size behavior as a Poisson Counter driven Stochastic Differential Equation and perform analysis. We use the data collected in to validate our modeling and analysis technique. Results indicate that our model is able to capture the behavior of TCP throughput quite accurately.
