Solutions To Elementary Differential Geometry

Most elementary and special functions that are encountered in physics and applied mathematics are solutions of linear differential equations (see Holonomic function). When physical phenomena are modeled with non-linear equations, they are generally approximated by linear differential equations for an easier solution.

An ordinary differential equation (ODE) is an equation containing an unknown function of one real or complex variable x , its derivatives, and some given functions of x .The unknown function is generally represented by a variable (often denoted y), which, therefore, depends on x .Thus x is often called the independent variable of the equation. The term "ordinary" is used in contrast with the term ...
